

Day 5 - Testing, Error Handling, and Backend Integration Refinement

Introduction

On Day 5, we focused on testing the marketplace for functionality, error handling, performance, and responsiveness.

Test cases related to deployment were scheduled for post-deployment execution.

Testing and Error Handling

We implemented various testing methodologies including unit tests, integration tests, and API testing. Error handling mechanisms were refined to ensure robustness.

Backend Integration Refinement

Backend APIs were optimized for better performance and security. Middleware updates were made to handle edge cases effectively.

Conclusion

The focus was on identifying and fixing potential errors before deployment. Ensuring a seamless user experience through proper testing and debugging was the key objective.
